

Nevion Viewer Release Notes

Revision 3.1.0
(2020-12-04)

What's new in version 3.1.0 (December 2020)

- * Includes .air file for AIR installation on Windows and Mac, as well as a native Windows application that can be run standalone (no installation required).
- * Added support for storing username and password for device IP addresses in the Nevion Viewer app.
- * Now uses a different way of refreshing when clicking the reload button. The new method prevents the memory usage from going up indefinitely.
- * Added a 64-bit version that supports memory usage above 2GB.
- * Updated version of AIR SDK 33.1.1.100 and the latest Apache Flex 4.16.1. The update to the AIR SDK fixes some crash bugs.

Known issues

- * Right clicking some elements in Functional Status or the status summary for that element, might produce the wrong context menu.
- * This version does not support HTTPS login to devices.
- * If a card is rebooted or a new card is detected, the user interface must be reloaded manually by clicking the reload button in the Nevion Viewer (reloading is not done automatically).
- * IP address/hostname can't contain extra characters like whitespace, the complete string will be used when connecting.
- * Generating complete system report might fail on devices with many expansion cards as there is a 30 second timeout for requests. Work-around is to generate system report for each expansion card individually.

What's new in version 3.0.4 (November 2020)

- * Native Windows application is now also digitally signed. Previously only the AIR installer file was signed.
- * Fixed a path issue on some Windows installations, by writing an extra permission entry where the path includes escape codes.
- * Now writes permission document to "appData" instead of "Application Data". The "Application Data" link name is dependent on the language of the OS.
- * Includes .air file for AIR installation on Windows and Mac, as well as a native Windows application that can be run standalone (no installation required).
